Foglight OnDemand
Beta

for VMware

Foglight on Demand (FoD) for VMware

FoD for VMware provides full management of your VMware vSphere environment as a service (Saas). No need to allocate special infrastructure for management: simply install our Point-of –Presence and hook it up to our monitoring cloud. We'll do the rest.

⭐ **Management of VMware vSphere delivered as a service (SaaS)**
⭐ **Less than $1/VM/month**
⭐ **Set-up in seconds – just hook us up to your vCenter, we'll do the rest**
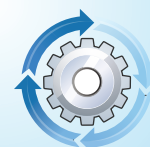

Monitor

FoD monitors your VMware vSphere infrastructure for performance and availability. It shows you what the current serious bottlenecks and issues are, and lets you investigate both the cause and the impact so that you can resolve them quickly.

FoD provides a clear performance and availability visualization which is combined with a small number of rules designed to alert you to immediately actionable problems.

Optimize

FoD lets you look for things that are worth fixing. Simply scan for particular issues of configuration and resource allocation. Get clear recommendations to speed resolution and use the unique Recommend Index to prioritize work on your VMware environment to gain the greatest benefit for the least effort.

Examine

Sometimes you just need to be able to quickly examine your vSphere environment and see just how much capacity you have left. At the same time you probably don't have time to spend working out precisely what future workloads you intend to deploy as virtual machines, you simply need a good approximation displayed quickly. FoD makes this simple with its Easy as 123 interface.

This is only one aspect of capacity and resource management, keeping track of performance, availability and utilization is key to answering questions like:

➤ Where do I have the most available resources?
➤ What are the values of my key performance indicators?
➤ Where is my infrastructure working hardest?

Predict

Forecasting when you will need more resources for your vSphere environment and knowing what they will be is key to providing for the future of the VMware infrastructure and the business activities it supports.

FoD shows you just when you can expect to need more resources and what types you will need.

FoD makes it easy to understand what is needed, when, and even why. All this makes purchase justification a much simpler and timely task.

Compare

Knowing how your VMware environment stacks up relative to others lets you understand whether you are ahead of the game or whether you have some catching up to do.

FoD can provide valuable insights into simple areas for improvement. Once you start asking questions you can go further and find out what it is about the wider community that makes your vSphere environment different from theirs and how you might improve your own.
